Example script for SpatialDeltaGLMM for spatio-temporal analysis of catch-rate data

James Thorson

October 10, 2016

Contents

1 Overview

This tutorial will walk through a simple example of how to use `SpatialDeltaGLMM` for estimating abundance indices, distribution shifts, and range expansion.

2 Getting started

First, we install necessary packages. We also have to install TMB as appropriate for the operating system (see directions elsewhere).

```
devtools::install_github("nwfsc-assess/geostatistical_delta-GLMM")
devtools::install_github("james-thorson/utilities")
```

Next load libraries.

```
library(TMB)               # Can instead load library(TMBdebug)
library(SpatialDeltaGLMM)
```

2.1 Further information

If you have further questions after reading this tutorial, please explore the GitHub repo mainpage, wiki, and glossary. Also please explore the R help files, e.g., `?PlotIndex_Fn`.

2.2 Related tools

Related tools for spatio-temporal fisheries analysis are currently housed at www.FishStats.org. These include VAST, a multispecies extension of SpatialDeltaGLMM, and www.FishViz.org, a tool for visualizing results using SpatialDeltaGLMM worldwide.

2.3 How to cite SpatialDeltaGLMM

`SpatialDeltaGLMM` has involved many publications for developing individual features. If using SpatialDeltaGLMM, please read and cite:

```
citation("SpatialDeltaGLMM")
```

```
##
## Please cite 2015 (ICES J. Mar. Sci. J.

```

and also browse the GitHub list of packages.

3 Settings

First chose an example data set for this script, as archived with package

```
Data_Set = c("Chatham_rise_hake", "Iceland_cod", "WCGBTS_canary",
    "GSL_american_plaice", "BC_pacific_cod", "EBS_pollock",
    "GOA_Pcod", "GOA_pollock", "GB_spring_haddock",
    "GB_fall_haddock", "SAWC_jacopever", "Aleutian_islands_POP")[4]
```

Next use latest version for CPP code

```
Version = "geo_index_v4b"
```

3.1 Spatial settings

The following settings define the spatial resolution for the model, and whether to use a grid or mesh approximation

```
Method = c("Grid", "Mesh")[2]
grid_size_km = 25
n_x = c(100, 250, 500, 1000, 2000)[1] # Number of stations
Kmeans_Config = list( "randomseed"=1, "nstart"=100, "iter.max"=1e3 )
```

3.2 Model settings

The following settings define whether to include spatial and spatio-temporal variation, whether its autocorrelated, and whether there's overdispersion

```
FieldConfig = c(Omega1 = 1, Epsilon1 = 1, Omega2 = 1,
    Epsilon2 = 1)
RhoConfig = c(Beta1 = 0, Beta2 = 0, Epsilon1 = 0, Epsilon2 = 0)
VesselConfig = c(Vessel = 0, VesselYear = 0)
ObsModel = 2
```

3.3 Stratification for results

We also define any potential stratification of results, and settings specific to any case-study data set

```
# Default
if (Data_Set %in% c("GSL_american_plaice", "BC_pacific_cod",
    "EBS_pollock", "SAWC_jacopever", "Chatham_rise_hake",
    "Aleutian_islands_POP")) {
    strata.limits <- data.frame(STRATA = "All_areas")
}
# Specific (useful as examples)
if (Data_Set %in% c("WCGBTS_canary", "Sim")) {
    # In this case, it will calculate a coastwide
    # index, and also a separate index for each state
    # (although the state lines are approximate)
    strata.limits <- data.frame(STRATA = c("Coastwide",
        "CA", "OR", "WA"), north_border = c(49, 42,
        46, 49), south_border = c(32, 32, 42, 46),
        shallow_border = c(55, 55, 55, 55), deep_border = c(1280,
            1280, 1280, 1280))
    # Override default settings for vessels
    VesselConfig = c(Vessel = 0, VesselYear = 1)
}
if (Data_Set %in% c("GOA_Pcod", "GOA_pollock")) {
    # In this case, will calculating an unrestricted
```

```r
    # index and a separate index restricted to west of
    # -140W
    strata.limits <- data.frame(STRATA = c("All_areas",
        "west_of_140W"), west_border = c(-Inf, -Inf),
        east_border = c(Inf, -140))
}
if (Data_Set %in% c("GB_spring_haddock", "GB_fall_haddock")) {
    # For NEFSC indices, strata must be specified as a
    # named list of area codes
    strata.limits = list(Georges_Bank = c(1130, 1140,
        1150, 1160, 1170, 1180, 1190, 1200, 1210, 1220,
        1230, 1240, 1250, 1290, 1300))
}
if (Data_Set %in% c("Iceland_cod")) {
    strata.limits = data.frame(STRATA = "All_areas")
    # Turn off all spatial, temporal, and
    # spatio-temporal variation in probability of
    # occurrence, because they occur almost everywhere
    FieldConfig = c(Omega1 = 0, Epsilon1 = 0, Omega2 = 1,
        Epsilon2 = 1)
    RhoConfig = c(Beta1 = 3, Beta2 = 0, Epsilon1 = 0,
        Epsilon2 = 0)
}
```

3.4 Derived objects

Depending on the case study, we define a `Region` used when extrapolating or plotting density estimates. If its a different data set, it will define `Region="Other"`, and this is a recognized level for all uses of `Region` (which attempts to define reasonable settings based on the location of sampling). For example `Data_Set="Iceland_cod"` has no associated meta-data for the region, so it uses `Region="Other"` by default.

```r
Region = switch( Data_Set, "Chatham_rise_hake"="New_Zealand",
                 "WCGBTS_canary"="California_current",
                 "GSL_american_plaice"="Gulf_of_St_Lawrence",
                 "BC_pacific_cod"="British_Columbia",
                 "EBS_pollock"="Eastern_Bering_Sea",
                 "GOA_Pcod"="Gulf_of_Alaska",
                 "GOA_pollock"="Gulf_of_Alaska",
                 "GB_spring_haddock"="Northwest_Atlantic",
                 "GB_fall_haddock"="Northwest_Atlantic",
                 "SAWC_jacopever"="South_Africa",
                 "Aleutian_islands_POP"="Aleutian_Islands",
                 "Other")
```

3.5 Save settings

We then set the location for saving files.

```r
DateFile = paste0(getwd(),'/SpatialDeltaGLMM_output/')
  dir.create(DateFile)
```

I also like to save all settings for later reference, although this is not necessary.

```
Record = ThorsonUtilities::bundlelist(c("Data_Set",
    "strata.limits", "Region", "Version", "Method",
    "grid_size_km", "n_x", "FieldConfig", "RhoConfig",
    "VesselConfig", "ObsModel", "Kmeans_Config"))
save(Record, file = file.path(DateFile, "Record.RData"))
capture.output(Record, file = paste0(DateFile, "Record.txt"))
```

4 Prepare the data

4.1 Data-frame for catch-rate data

Depending upon the `Data_Set` chosen, we load archived data sets that are distributed with the package. Each archived data set is then reformatted to create a data-frame `Data_Geostat` with a standardized set of columns. For a new data set, the user is responsible for formatting `Data_Geostat` appropriately to match this format. We show the first six rows of `Data_Geostat` given that Data_Set = `Data_Set`.

Year	Lat	Lon	Vessel	AreaSwept_km2	Catch_KG
1971	48	-64.8	missing	0.0324	129
1971	48	-65.1	missing	0.0393	88.6
1971	47.9	-65.2	missing	0.0509	38.2
1971	47.9	-65.5	missing	0.037	139
1971	48	-64.6	missing	0.0509	0.786
1971	48.2	-64.5	missing	0.044	0.637

4.2 Extrapolation grid

We also generate the extrapolation grid appropriate for a given region. For new regions, we use `Region="Other"`.

```
if (Region %in% c("California_current", "Eastern_Bering_Sea",
    "Gulf_of_Alaska", "Aleutian_Islands", "Northwest_Atlantic",
    "Gulf_of_St_Lawrence", "New_Zealand")) {
    Extrapolation_List = Prepare_Extrapolation_Data_Fn(Region = Region,
        strata.limits = strata.limits)
}
if (Region == "British_Columbia") {
    Extrapolation_List = Prepare_Extrapolation_Data_Fn(Region = Region,
        strata.limits = strata.limits, strata_to_use = c("HS",
            "QCS"))
}
if (Region == "South_Africa") {
    Extrapolation_List = Prepare_Extrapolation_Data_Fn(Region = Region,
        strata.limits = strata.limits, region = "west_coast")
}
if (Region == "Other") {
    Extrapolation_List = Prepare_Extrapolation_Data_Fn(Region = Region,
        strata.limits = strata.limits, observations_LL = Data_Geostat[,
            c("Lat", "Lon")], maximum_distance_from_sample = 15)
}
```

4.3 Derived objects for spatio-temporal estimation

And we finally generate the information used for conducting spatio-temporal parameter estimation, bundled in list `Spatial_List`

```
Spatial_List = Spatial_Information_Fn(grid_size_km = grid_size_km,
    n_x = n_x, Method = Method, Lon = Data_Geostat[,
        "Lon"], Lat = Data_Geostat[, "Lat"], Extrapolation_List = Extrapolation_List,
    randomseed = Kmeans_Config[["randomseed"]], nstart = Kmeans_Config[["nstart"]],
    iter.max = Kmeans_Config[["iter.max"]], DirPath = DateFile,
    Save_Results = FALSE)
# Add knots to Data_Geostat
Data_Geostat = cbind(Data_Geostat, Spatial_List$loc_UTM,
    knot_i = Spatial_List$knot_i)
```

5 Build and run model

5.1 Build model

To estimate parameters, we first build a list of data-inputs used for parameter estimation. `Data_Fn` has some simple checks for buggy inputs, but also please read the help file `?Data_Fn`.

```
TmbData = Data_Fn(Version = Version, FieldConfig = FieldConfig,
    RhoConfig = RhoConfig, ObsModel = ObsModel, b_i = Data_Geostat[,
        "Catch_KG"], a_i = Data_Geostat[, "AreaSwept_km2"],
    v_i = as.numeric(Data_Geostat[, "Vessel"]) - 1,
    s_i = Data_Geostat[, "knot_i"] - 1, t_i = Data_Geostat[,
        "Year"], a_xl = Spatial_List$a_xl, MeshList = Spatial_List$MeshList,
    GridList = Spatial_List$GridList, Method = Spatial_List$Method,
    Options = c(SD_site_density = 0, SD_site_logdensity = 0,
        Calculate_Range = 1, Calculate_evenness = 0,
        Calculate_effective_area = 1))
```

We then build the TMB object.

```
TmbList = Build_TMB_Fn(TmbData = TmbData, RunDir = DateFile,
    Version = Version, RhoConfig = RhoConfig, VesselConfig = VesselConfig,
    loc_x = Spatial_List$loc_x)
Obj = TmbList[["Obj"]]
```

5.2 Estimate fixed effects and predict random effects

Next, we use a gradient-based nonlinear minimizer to identify maximum likelihood estimates for fixed-effects

```
Opt = TMBhelper::Optimize(obj = Obj, lower = TmbList[["Lower"]],
    upper = TmbList[["Upper"]], getsd = TRUE, savedir = DateFile,
    bias.correct = FALSE)
```

Finally, we bundle and save output

```r
Report = Obj$report()
Save = list("Opt"=Opt, "Report"=Report, "ParHat"=Obj$env$parList(Opt$par), "TmbData"=TmbData)
save(Save, file=paste0(DateFile,"Save.RData"))
```

6 Diagnostic plots

We first apply a set of standard model diagnostics to confirm that the model is reasonable and deserves further attention. If any of these do not look reasonable, the model output should not be interpreted or used.

6.1 Plot data

It is always good practice to conduct exploratory analysis of data. Here, I visualize the spatial distribution of data. Spatio-temporal models involve the assumption that the probability of sampling a given location is statistically independent of the probability distribution for the response at that location. So if sampling "follows" changes in density, then the model is probably not appropriate!

```r
Plot_data_and_knots(Extrapolation_List = Extrapolation_List,
    Spatial_List = Spatial_List, Data_Geostat = Data_Geostat,
    PlotDir = DateFile)
```

6.2 Convergence

Here I print the diagnostics generated during parameter estimation, and I confirm that (1) no parameter is hitting an upper or lower bound and (2) the final gradient for each fixed-effect is close to zero. For explanation of parameters, please see `?Data_Fn`.

```r
pander::pandoc.table( Opt$diagnostics[,c('Param','Lower','MLE','Upper','final_gradient')] )
```

6.3 Diagnostics for encounter-probability component

Next, we check whether observed encounter frequencies for either low or high probability samples are within the 95% predictive interval for predicted encounter probability

```
Enc_prob = Check_encounter_prob(Report = Report, Data_Geostat = Data_Geostat,
    DirName = DateFile)
```

6.4 Diagnostics for positive-catch-rate component

We can visualize fit to residuals of catch-rates given encounters using a Q-Q plot. A good Q-Q plot will have residuals along the one-to-one line.

```
Q = QQ_Fn(TmbData = TmbData, Report = Report, FileName_PP = paste0(DateFile,
    "Posterior_Predictive.jpg"), FileName_Phist = paste0(DateFile,
    "Posterior_Predictive-Histogram.jpg"), FileName_QQ = paste0(DateFile,
    "Q-Q_plot.jpg"), FileName_Qhist = paste0(DateFile,
    "Q-Q_hist.jpg"))
```

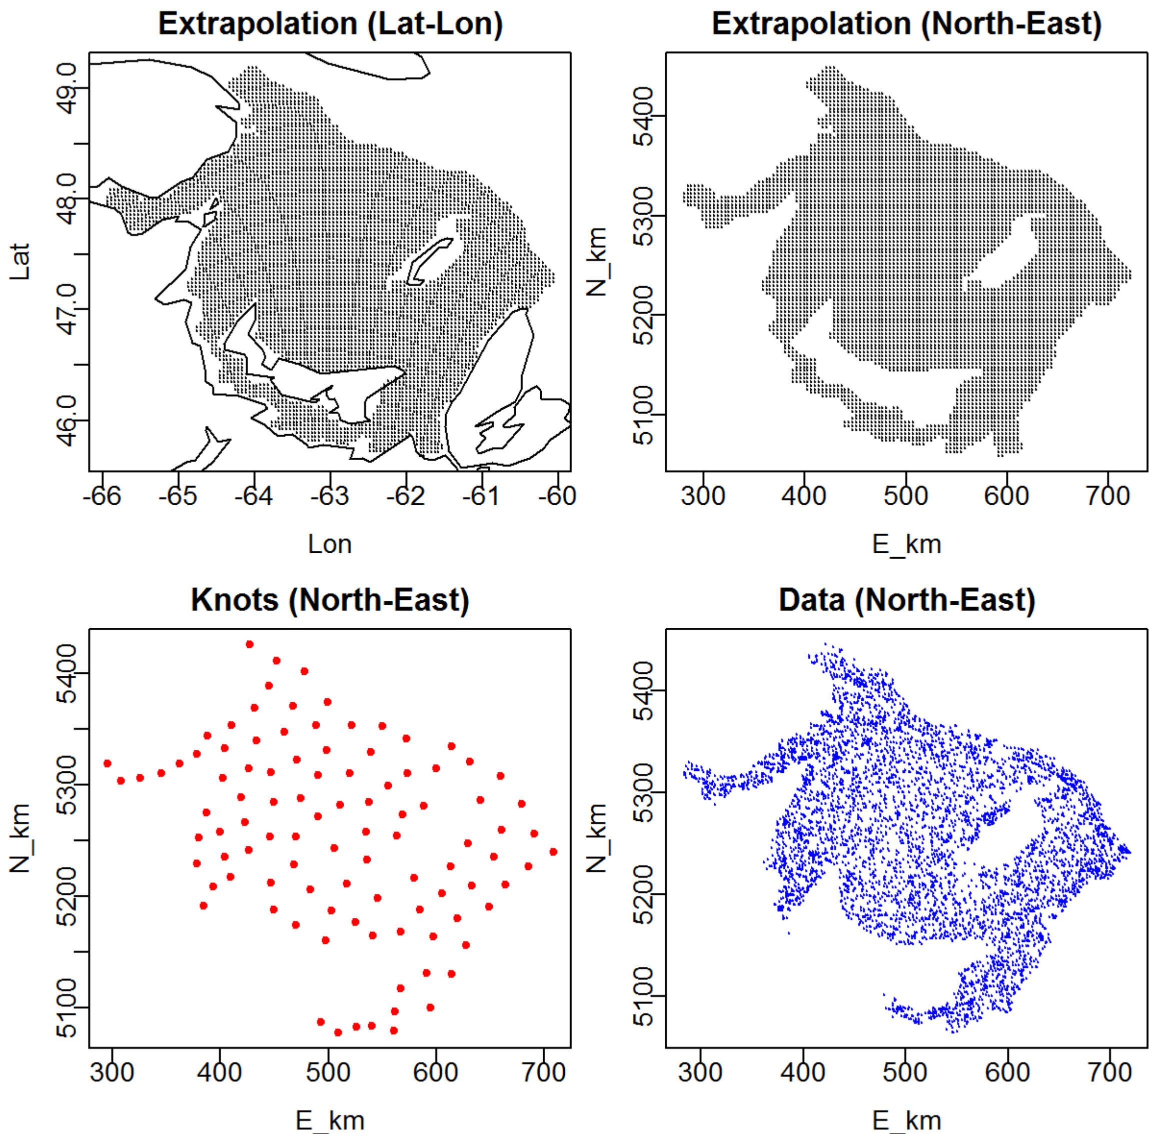

Figure 1: Spatial extent and location of knots

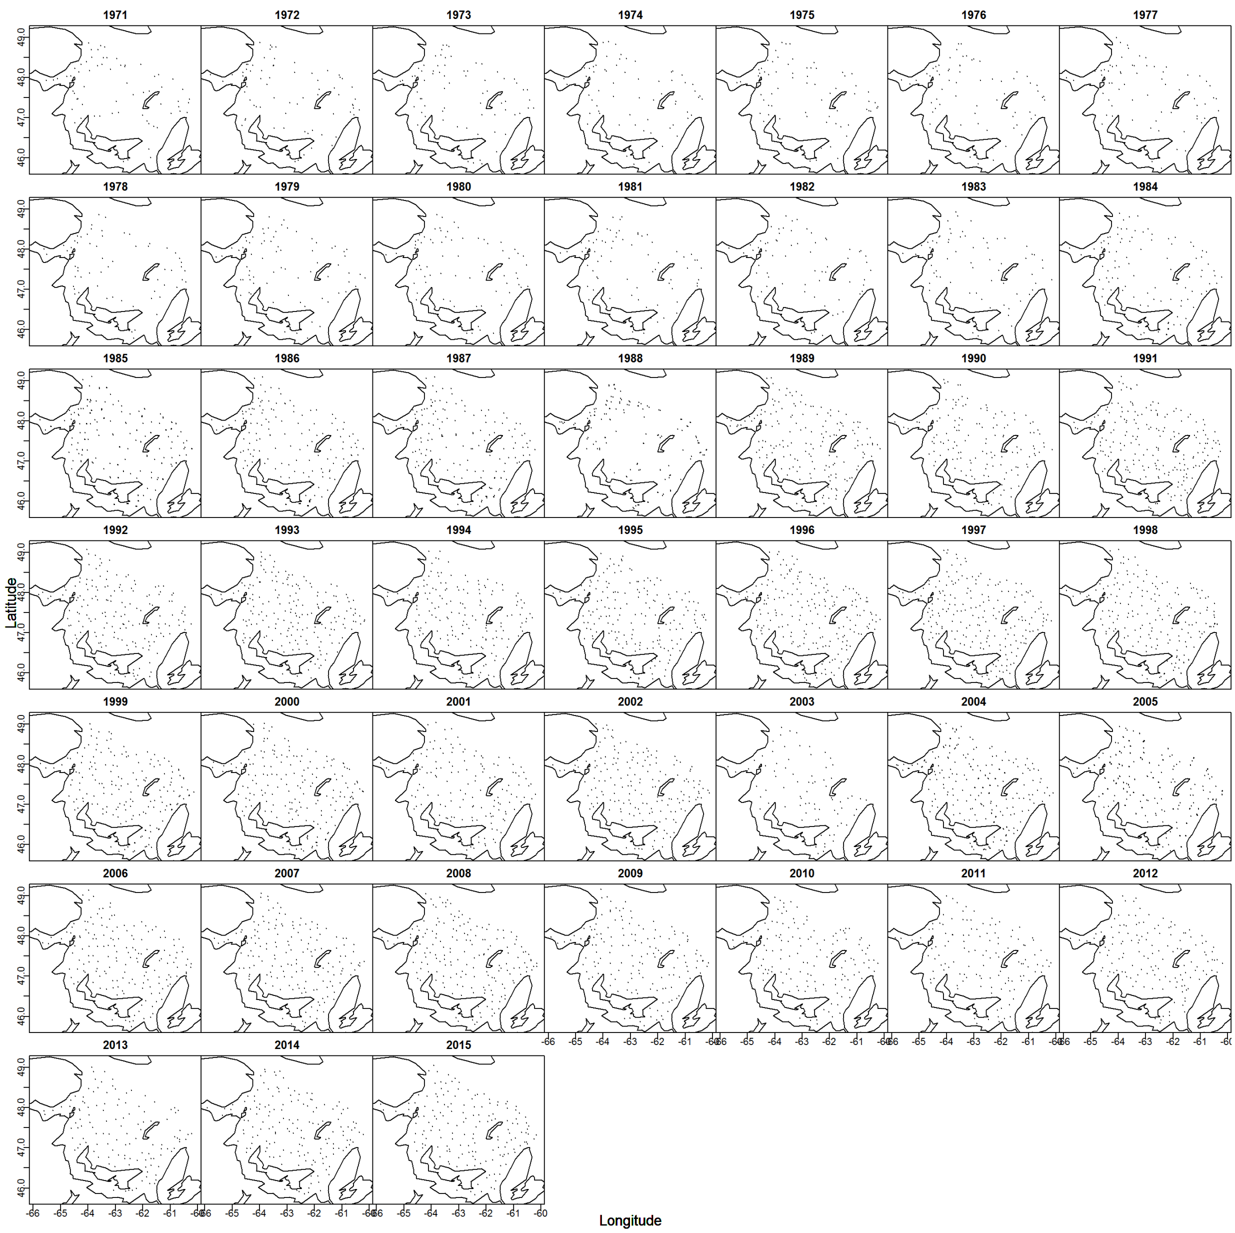

Figure 2: Spatial distribution of catch-rate data

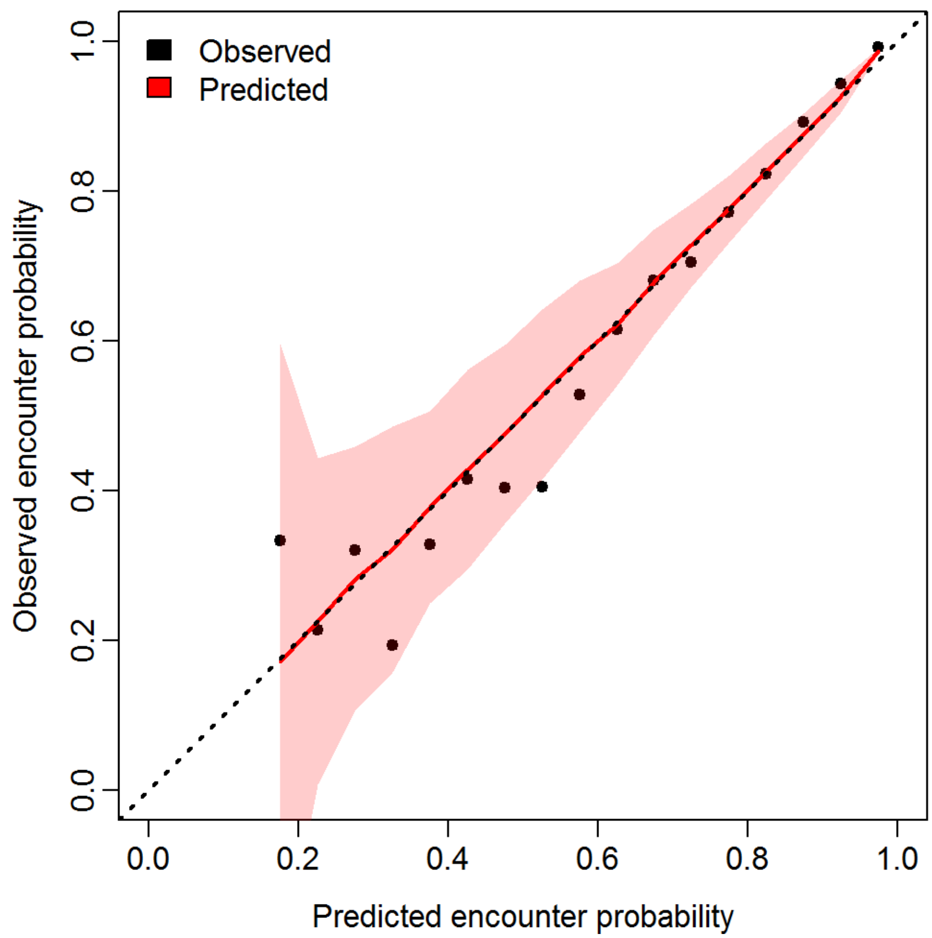

Figure 3: Expectated probability and observed frequency of encounter for “encounter probability” component

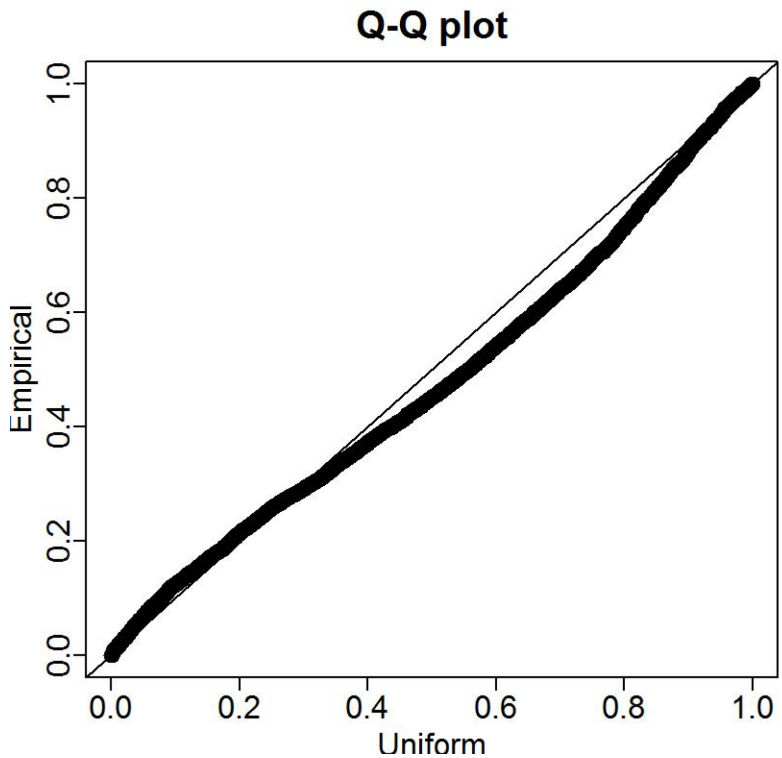

Figure 4: Quantile-quantile plot indicating residuals for "positive catch rate" component

6.5 Model selection

To select among models, we recommend using the Akaike Information Criterion, AIC, via `Opt$AIC= 4.523\times 10^{4}`.

7 Model output

Last but not least, we generate useful plots by first determining which years to plot (`Years2Include`), and labels for each plotted year (`Year_Set`)

```
Year_Set = seq(min(Data_Geostat[,'Year']),max(Data_Geostat[,'Year']))
Years2Include = which( Year_Set %in% sort(unique(Data_Geostat[,'Year'])))
```

We then run a set of pre-defined plots for visualizing results

7.1 Direction of "geometric anisotropy"

We can visualize which direction has faster or slower decorrelation (termed "geometric anisotropy")

```
PlotAniso_Fn( FileName=paste0(DateFile,"Aniso.png"), Report=Report, TmbData=TmbData )
```

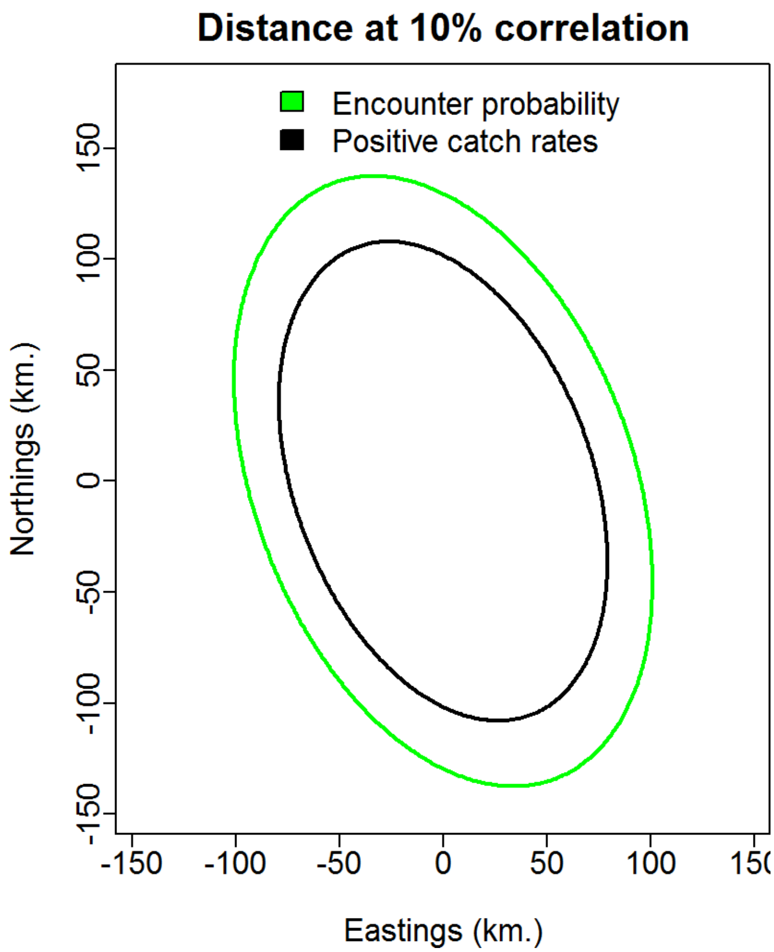

Figure 5: Decorrelation distance for different directions

7.2 Density surface for each year

We can visualize many types of output from the model. Here I only show predicted density, but other options are obtained via other integers passed to `plot_set` as described in `?PlotResultsOnMap_Fn`

```
# Get region-specific settings for plots
MapDetails_List = MapDetails_Fn(Region = Region, NN_Extrap = Spatial_List$PolygonList$NN_Extrap,
    Extrapolation_List = Extrapolation_List)
# Plot maps representing density or other variables
PlotResultsOnMap_Fn(plot_set = c(3), MappingDetails = MapDetails_List[["MappingDetails"]],
    Report = Report, Sdreport = Opt$SD, PlotDF = MapDetails_List[["PlotDF"]],
    MapSizeRatio = MapDetails_List[["MapSizeRatio"]],
    Xlim = MapDetails_List[["Xlim"]], Ylim = MapDetails_List[["Ylim"]],
    FileName = DateFile, Year_Set = Year_Set, Years2Include = Years2Include,
    Rotate = MapDetails_List[["Rotate"]], Cex = MapDetails_List[["Cex"]],
    Legend = MapDetails_List[["Legend"]], zone = MapDetails_List[["Zone"]],
    mar = c(0, 0, 2, 0), oma = c(3.5, 3.5, 0, 0), cex = 1.8)
```

7.3 Index of abundance

The index of abundance is generally most useful for stock assessment models.

```
Index = PlotIndex_Fn(DirName = DateFile, TmbData = TmbData,
    Sdreport = Opt[["SD"]], Year_Set = Year_Set, Years2Include = Years2Include,
    strata_names = strata.limits[, 1], use_biascorr = TRUE)
pander::pandoc.table(Index$Table[, c("Year", "Fleet",
    "Estimate_metric_tons", "SD_log", "SD_mt")])
```

Year	Fleet	Estimate_metric_tons	SD_log	SD_mt
1971	All_areas	47684	0.1871	8922
1972	All_areas	70145	0.1995	13993
1973	All_areas	70018	0.1913	13396

2015	All_areas	24343	0.1035	2520

7.4 Center of gravity and range expansion/contraction

We can detect shifts in distribution or range expansion/contraction.

```r
Plot_range_shifts(Report = Report, TmbData = TmbData,
    Sdreport = Opt[["SD"]], Znames = colnames(TmbData$Z_xm),
    PlotDir = DateFile)
```

7.5 Vessel effects if included

Most example data-sets don't have vessel effects, so this plot is generally skipped

```r
Return = Vessel_Fn(TmbData = TmbData, Sdreport = Opt[["SD"]],
    FileName_VYplot = paste0(DateFile, "VY-effect.jpg"))
```

```
## Not plotting vessel effects because none are present
```
